TI Potentiation of CB 1954 cytotoxicity by reduced pyridine nucleotides in
human tumor cells by stimulation of **DT diaphorase**
activity

AB The toxicity of CB 1954 [5-(aziridin-1-yl)-2,4-dinitrobenzamide] towards
human cells was greatly enhanced by NADH (when fetal calf serum was
present in the culture medium) and by nicotinamide riboside (reduced)
(NRH), but not by nicotinate riboside (reduced). Co-treatment of human
cells with CB 1954 and NADH resulted in the formation of crosslinks in
their DNA. The toxicity produced by other DNA crosslinking agents was
unaffected by reduced nicotinamide compds. When caffeine was included in
the medium, a reduction in the cytotoxicity of CB 1954 occurred. The toxicity
experienced by human cell lines after exposure to CB 1954 and NADH was
proportional to their levels of the enzyme **DT diaphorase**
[NAD(P)H dehydrogenase (quinone), (EC 1.6.99.2.)]. It is concluded that
NRH, which the authors have shown to be a co-factor for rat **DT**
diaphorase (Friedlos et al., Biochem Pharmacol 44; 25-31, 1992),
is generated from NADH by enzymes in fetal calf serum, and stimulates the
activity of human **DT diaphorase** towards CB 1954.

 AB . . . in insensitive cells. Crosslink formation is due to the aerobic
 reduction of CB 1954 to form 5-(aziridin-1-yl)-4-hydroxylamino-2-
 nitrobenzamide by the enzyme **DT diaphorase**. The
 4-hydroxylamine can not crosslink DNA directly but requires further
 activation by a non-enzymic reaction with a thioester (such as acetyl
 CoA). As predicted from their measured **DT diaphorase**
 activities, a number of rat hepatoma and hepatocyte cell lines are also
 sensitive to CB 1954. However, no CB 1954-sensitive. . . human origin
 have been found. This is because the rate of reduction of CB 1954 by the

human form of **DT diaphorase** is much lower than that of the Walker enzyme (ratio of Kcat = 6.4). To overcome this intrinsic resistance of. . . (ADEPT). A nitroreductase enzyme has been isolated from E. coli that can bioactivate CB 1954 much more rapidly than Walker **DT diaphorase** and is very suitable for ADEPT. Thus CB 1954 may have a role in the therapy of human tumors.

diaphorase activity is reported to investigate the toxicity of a
 variety of bioreductive agents under both aerobic and hypoxic conditions.
 The. . . for any one agent, may differ markedly under aerobic and
 hypoxic conditions. The studies also show that while the enzyme
 DT-**diaphorase** plays a major role in determining mitomycin C
 (MM-C) toxicity under aerobic conditions, this is not true for hypoxic
 conditions.. . .

L17 ANSWER 10 OF 13 CAPLUS COPYRIGHT 2006 ACS on STN

- TI The differences in kinetics of rat and human **DT diaphorase** result in a differential sensitivity of derived cell lines to CB 1954 (5-(aziridin-1-yl)-2,4-dinitrobenzamide)
- AB **DT diaphorase** (NAD(P)H dehydrogenase (quinone), EC 1.6.99.2) isolated from Walker 256 rat carcinoma cells can convert CB 1954 to a cytotoxic DNA. . . CB 1954 when compared with other cells which are unable to carry out this reduction As predicted from their measured **DT diaphorase** activities a number of rat hepatoma and hepatocyte cell lines were also shown to be sensitive to CB 1954. However, no CB 1954-sensitive cell lines of human origin were found, although levels of **DT diaphorase** similar to those in the sensitive rat cells were present in these cells. The human cells were as sensitive as rat cells to the active form of CB 1954 (5-(aziridin-1-yl)-4-hydroxylamino-2-nitrobenzamide). **DT diaphorase**, purified to homogeneity from human Hep G2 cells, did metabolize CB 1954 to this 4-hydroxylamino product, but the rate of. . . 6.4). In addition, CB 1954 could be considered an inhibitor of, rather than a substrate for, the human form of **DT diaphorase**. The purified rat and human **DT diaphorases** possessed otherwise similar biochem. and mol. properties. These findings explain the decreased sensitivity towards CB 1954 of human cell lines. . .
